Process for specifically modulating the properties of an intracellular target molecule used for the treatment of various disorders.

Example 1; Fig 1; 33pp; English.

The present invention relates to a process for specifically modulating the properties of an intracellular target molecule T, and/or of a cellular component C which interacts directly or indirectly in a cell with the target. The process involves the introduction into the cell of a chimeric molecule known as a targeted effector, comprising a recognition moiety capable of recognising T and an effector moiety. The chimeric protein or nucleic acid can be used in the preparation of a medicament for the treatment of microbial infections, immunological disorders, neurological disorders, psychiatric disorders,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAR89340-R89351 are Cdk-2 interacting peptides identified by an interaction trap assay using conformationally-constrained proteins. The assay comprises providing a host cell (esp. a yeast cell) which contains: (i) a reporter gene operably linked to a DNA-binding protein recognition site, pref. LexA; (ii) a 1st fusion gene expressing Cdk-2 covalently a conformationally-constrained (pref. with thioredoxin) protein (either expected to interact with Cdk-2 or a random peptide) covalently bonded to a gene-activating moiety, and measuring expression of the reporter gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  as a measure of interaction between Cdk2 and the conformationally constrained protein. The same system may be applied to find proteins that interact with any other protein of interest (e.g. Ras) or proteins having
myopathies, genetic disorders, cancer, cardiovascular disorders and dental disorders. The present sequence is a mutant of a known anti-Cdk2 aptamer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Interaction trap systems using conformationally-constrained proteins useful for detection of protein interactions and for identification and isolation of interacting proteins.

New trap system for detecting protein interactions - comprises a reporter gene linked to a DNA-binding-protein recognition site and fusion proteins to test for interactions.
                                                                                                                                                                                                                         Aptamers AAW32116-W32132 have been isolated from a peptide library and are used in a novel interaction trap method for detecting protein interactions and isolating novel proteins. The method involves a host cell containing a reporter gene operably linked to a DNA-binding-protein (DBP) recognition site, a fusion gene capable of expressing a fusion protein which is able to specifically bind to the DBP recognition site and a second fusion gene which expresses a second fusion protein which is conformationally constrained and bonded to a gene activating molety. Measuring expression of the reporter gene gives a measure of the interaction between Pl and P2. This method can be used to identify agonists or antagonists for use as therapeutic molecules or for the design of simple molecule mimetics. The method is specifically used to detect an interacting protein in a population of proteins or to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              a candidate interactor. Using conformationally constrained proteins can provide for tertiary structural analysis and can also protect proteins from cellular degradation and/or increase the protein's solubility, and/or otherwise alter the capacity of the candidate interactor to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 117; DB 2; Length 20;

```
The invention relates to a population of Saccharomyces and/or mammalian cells comprising recombinant DNA molecules encoding fusion proteins, each consisting of a candidate interactor peptide, a conformation-constraining protein and a DNA binding moiety and/or gene activating moiety. The cells are useful for detecting protein interactions. The cells may also be used in a method for identifying and purifying genes encoding a wide range of useful proteins based on their physical interaction with a second
                                                                                                                                                                                                                                                                                                                                                                                                                                            Population of Saccharomyces and/or mammalian cells comprising recombinant DNA encoding fusion proteins, useful for detecting protein interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antimicrobial; immunomodulatory; nootropic; neuroprotective; metabolic; neuroleptic; cytostatic; cardiant; infection; immunological disorder; neurological disorder; metabolic disorder; psychiatric disorder; myopathy; cancer; cardiovascular disorder.

                                                                                                                                                                                                                                                                                The present invention relates to a process for specifically modulating the properties of an intracellular target molecule T, and/or of a cellular component C which interacts directly or indirectly in a cell with the target. The process involves the introduction into the cell of a chimeric molecule known as a targeted effector, comprising a recognition moiety capable of recognising T and an effector moiety. The chimeric protein or nucleic acid can be used in the preparation of a medicament for the treatment of microbial infections, immunological disorders, metabolic disorders, psychiatric disorders, myopathies, genetic disorders, candiovascular disorders, and dental disorders. The present sequence is a known anti-Cdk2 aptamer used in the exemplification of the invention
                                                                                                                                                                                                          Process for specifically modulating the properties of an intracellular target molecule used for the treatment of various disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

sequences. (1) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerlectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of stee expressing (II). (I) are useful in medical imaging involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the way are appeared by the printed specification, but was obtained in the way are appeared by the printed specification of mutation and sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of
                                                                                                                                                                                                                                                                             The invention relates to isolated polynucleotide (I) and polypeptide (II)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bacterial infection; Pseudomonas aeruginosa infection; antibacterial.
                      New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 45.7%; Score 59; DB 4; Length 118; 60.0%; Pred. The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and plantage interapt of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a carterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO8486 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but, was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to Pseudomonas aeruginosa polypeptides and the polymuclectides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide,

for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-deruge peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences for pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this parent did not form part of the printed specification but was obtained in electronic format from USPTO at

The present invention relates to the isolation of novel human respiratory antigens, and cDNA (AAS27869-AAS28159) and genomic sequences encoding for these polypeptides. The sequences of the invention are useful for preventing, treating and/or prognosing disorders related to the respiratory system including throat disorders (e.g. vocal cord paralysis, tonsillitis, and laryngitis), lung disorders e.g. pneumonia, allergic disorders are of asthma, pleurisy, cystic fibrosis, emphysema, nos polymucleotide sequences of the respiratory tissues e.g. lung cancer. The polymucleotide sequences of the invention are useful in gene therapy and antisense therapy. AAUT/88-AAUT/975 represent novel human respiratory antigens. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated polypeptide for treating, preventing and/ or prognosing disorders related to the respiratory system including respiratory cancers and also for testing and detection e.g. diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

RESULT 11 ADG22291

ADG22291 standard; protein; 122 AA.

ADG22291; AXD

The invention describes an isolated polypeptide (I) comprising an amino acid sequence that is at least 90% identical to polypeptide fragment of acid sequence that is at least 90% identical to polypeptide fragment of biological activity, polypeptide domain or epitope of PS, all-length biological activity, polypeptide domain or epitope of PS, full-length protein of PS, or variant, allelic variant or species homolog of PS. (I) concerned to a subject which involves determining (I) is also useful for diagnosing a pathological condition in a subject which involves determining the presence or absence of mutation or a subject which involves determining the presence or absence of mutation in (II) or determining the presence or amount of expression of (I) in a collogical sample and diagnosing a pathological condition based on the result. The human respiratory system associated polynucleotides, the polypeptides encoded by them, and antibodies that immunospecifically bind these polypeptides are useful in diagnosis, treatment, prevention and/or prognosis of disorders of respiratory system such as throat disorders (e.g., vocal cord paralysis, tonsilitis, and laryngitis), lung disorders (e.g., pneumonia), pleurisy, cystic fibrosis, emphysem, histiocytosis, cancers of respiratory tissues (e.g., throat cancer, lung cancer, and cancer of the nose). The polynucleotides are useful in gene therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ·,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the entire genome of cyanophage S-2L, and to the protein encoded by it. Genes isolated from the genome of S-2L are useful for preparing enzymes for synthesis of D-bases (D = 2,6-diaminopurine), particularly D, dDMP and dDTP, or polynucleotides containing these bases, polymerases involved in metabolism of D-bases and deoxynucleotide analogs, for chemotherapy of AIDS. The genes, and encoded polypeptides, can be used for detection and/or identification of S-2L, and for identifying agents that modulate synthesis of D-bases or polynucleotides containing them, and fusions of S-2L polypeptides with an antigon can be used to raise specific antibodies, useful for detecting S-2L. This sequence corresponds to one of the proteins encoded by the cyanophage S-
                                                                                                                                                                                                                                                                                                                                                                                                              genomic sequence for cyanophage S-2L, useful for identifying genes synthesis of 2,6-diaminopurine bases or polynucleotides containing

The invention relates to the entire genome of cyanophage S-2L, and to the protein encoded by it. Genes isolated from the genome of S-2L are useful for preparing enzymes for synthesis of D-bases (D = 2,6-diaminopurine), particularly D, dDMP and dDTP, or polymucleotides containing these bases, polymerases involved in metabolism of D-bases and deoxynucleotide analogs, for chemotherapy of AIDS. The genes, and encoded polypeptides, can be used for detection and/or identification of S-2L, and for identifying agents that modulate synthesis of D-bases or polymucleotides containing them, and fusions of S-2L polypeptides with an antigen can be used to raise specific antibodies, useful for detecting S-2L. This sequence corresponds to one of the proteins encoded by the cyanophage S-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   anticonvulsant, mootropic, neuroprotective, cerebroprotective; anti-HIV, antiallergic; antinffammatory; thyromimetic; gene therapy; cancer; cell proliferative disorder; atherosclerosis; neurological disorder; epilepsy; Huntington's disease; stroke; immune disorder; allergy; AIDS; inflammatory disorder; developmental disorder; hypothyroidism;

ACC79026 to ACC79105 encode the human secreted proteins (I) given in ABR56726 to ABR56805, designated SECP-1 to SECP-80. SECP sequences can have cytostatic, antiatreficestatic, anticonvulsant, antinflammatory, nootropic, neuroprotective, carebroprotective, anti-HIV, antiallargic and thyromimetic activities, and can be used in gene therapy. The SECP thyromimetic activities, and can be used in diagnosing, treating and proventing diseases or conditions associated with the decreased expression or overexpression of SECP, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. epilepsy, Huntington's disease, stroke), immune/inflammatory (e.g. ADIDS, allergies) and developmental (e.g. hypothyroidism, Cushing's syndrome) disorders, or infections. They are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of SECP. The SECP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polymcidetide, or in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human secreted proteins (SECP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant SECP expression e.g. cancer, AIDS, atherosclerosis, Huntington's disease, stroke, infections.

Woodchuck hepatitis b virus HBsAg PreS2-S region protein sequence.

(first entry)

```
This sequence is the woodchuck hepatitis virus surface antigen Pres2-S region. This sequence was used to create a recombinant antigen library comprises recombinant nucleic caids encoding antigenic polypeptides and is produced by recombination of at least two forms of nucleic acid, differing by at least two nucleotides, encoding a disease-recombinant multivalent polypeptides of the invention, that contains at least two antigenic polypeptides of the invention, that contains at least two antigenic polypeptides of the invention, that contains at least two antigenic polypeptides of the invention, that contains at least two antigenic polypeptides of the invention, that contains at least two antigenic polypeptides of the invention, that contains at least two antigenic polypeptides are used in vaccines to induce a protective or therapeutic response to a wide variety of infectious agents (bacteria, viruses, parasites, including plasmodium falciparum); allergens; asthma; autoimmune disease (e.g. rheumatoid arthritis, diabetes, multiple sclerosis); other inflammatory conditions and cancer, also, where directed against sperm antigens, they can be used for contraception. The multivalent peptides can be evolved to induce an

The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as
                                                                                                                                                                                                                                                                Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                                                                                                        Claim 5; SEQ ID NO 1389; 261pp + Sequence Listing; English.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Database

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Glutamate dehydrogenase (NADP) (EC 1.4.1.4) - Halobacterium salinarum
NiAlternene names: glutamic dehydrogenase; NADP-specific glutamate dehydrogenase
C;Species: Halobacterium salinarum
C;Date: 13-Jan-1995 #sequence_revision 23-Mar-1995 #text_change 09-Jul-2004
C;Accession: 186609
R;Benachenhou, N.; Baldacci, G.
Mol. Gen. Genet. 230, 345-352, 1991
A;Title: The gene for a halophilic glutamate dehydrogenase: sequence, transcription anal
A;Reference number: 518609; MUID:92114863; PMID:1766432
A;Accession: S18609
A;Molecule type: DNA
A;Residues: 1435 <-BEN>
A;Accession: Glate as Halobacterium salinarium
C;Superfamily: glutamate dehydrogenase (NAD(P) +)
C;Keywords: NADP; Oxidoreductase
F;126/Binding site: substrate (Lys) #status predicted

c. Natl. Acad. Sci. U.S.A. 97:12176-12181(2000).
CATALYTIC ACTIVITY: L-glutamate + H(2)O + NADP(+) = 2-oxoglutarate
                                                          + NH(3) + NADPH.
SUBUNIT: Homohexamer (By similarity).
SIMILARITY: Belongs to the Glu/Leu/Phe/Val dehydrogenases family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SIMILARITY: Belongs to family 27 of glycosyl hydrolases. SIMILARITY: Contains 1 ricin B-type lectin domain. CAUTION: It is uncertain whether Met-1 or Met-9 is the initiator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEQUENCE FROM N.A., AND SEQUENCE OF 32-59.

"Cloning and expression of a member of the Aspergillus niger gene
"Cloning and expression of a member of the Aspergillus niger gene
family encoding alpha-galactosidase.";
Mol. Gen. Genet. 233:404-410(1992).
-!- FUNCTION: Represents a minor extracellular alpha-galactosidase
activity in A.niger.
-!- CATALYTIC ACTIVITY: Melibiose + H(2)O = galactose + glucose.
-!- PTM: A C-terminal Ser/Thr-rich region may provide possible sites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                 gene sequence currently assigned to the NADP+-dependent enzyme is in fact that of the NAD+-dependent glutamate dehydrogenase."; FEMS Microbiol. Lett. 211:37-41(2002).
-!- CATALYTIC ATTULYTY: L-glutamate + H(2)0 + NAD(+) = 2-oxoglutarate + NH(3) + NADH.
-!- SUBUNIT: Homohexamer (By similarity).
-!- SIMILARITY: Belongs to the Glu/Leu/Phe/Val dehydrogenases family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

ALIGNMENTS

```
DNA encoding coffee bean alpha-galactosidase (CBG) was obtained by isolating mRNA from coffee beans, prepg. cDNA and subjecting this to PCR amplification using primers based on the amino acid sequence of CBG. A full-length cDNA clone is given in AAQ83523, which encoded a 42 kDa protein (AAR70205). Recombinant CBG was produced in Sf9 cells. CBG showed homology to alpha-galactosidases from guar, human placenta, S. cerevisiae and A. niger (AAR70206-09). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                            New recombinant coffee bean alpha-galactosidase - used for cleaving alphal, 3-linked galactose residues on the surface of cells for prodn. blood prods.
                                                                                                                                                      Alpha-galactosidase; coffee bean; CBG; alpha-1,3-linked galactose;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; Page 49-50; 67pp; English.

Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protein #5357 encoded by probe for measuring heart cell gene expression.
                 Peptide #5617 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              41.1%; Score 48.5; DB 4; Length 47; 60.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia,
                                                                                                                                                                             The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                                                                               Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human brain expressed single exon probe encoded protein SEQ ID NO: 30893.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Single exon nucleic acid probes for analyzing gene expression in human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;
                                                                                                                                                                                                                                                                                                                                                                                                                           probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, the hyperension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21535_ABA41305). The present sequence is a protein encoded by one such
                                                                                                                                                                                                                                                                        Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; bone marrow expressed exon; gene expression analysis; probe; microarray; cancer; leukaemia; lymphoma; myeloma.

mucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12887 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes with the human lung, comprising the novel set of probes with the human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the array, identifying exons in a eukaryotic genome, comprising (a) array; identifying exons in a eukaryotic genome, comprising (a) a glgorithmically predicting at least one exon from general exon probe, contacting a fragment identical to the predicted exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon probe, comprising (a) measuring the expression of each of the exons in several
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a spatially-addressable set of single exon
```

measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification for complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG59930 represent human lifter single exon encoded peptides of the invention. Note: The sequence but was obtained in electronic format directly from NIPO at fitp.wipo.int/pub/published_pot_sequences

```
microarrays having a probe with the exon, where a common pattern of microarrays having a probe with the exon, where a common pattern of the expression of the exons in the tissues and/or cell types indicates that the expression of the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human ung derived mRNA and for the study of lung diseases such as asthma, lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung diseases (LID), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-Dulak syndrome, sarcoidosis, pulmonary lamonary alvolar proteinosis, thatioocytosis, lymphangioleiomyomicosis, pulmonary alvolar proteinosis, Asragener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp. wipo.int/pub/published_pct_sequences

Claim 20; Page 55; 123pp; English.

The invention provides an antibody (Ab) comprising donor CDRs (complementarity determining regions) derived from a non-human antigenspectific donor antibody, and an acceptor framework from a non-human primate. The Abs are prepared by grafting CDRs from a non-human antigenspecific donor antibody onto homologous Old World ape or monkey acceptor frameworks. The Abs have reduced immunogenicity and are better tolerated

Sequence 98 AA;

The invention relates to an isolated lung specific polypeptide comprising an amino acid sequence 60% identical to a sequence chosen from 61 sequences such as 68, 63, 569, 51, 105, 711, 49 or 77 amino acids, or an amino acid sequence encoded by a nucleic acid molecule comprising a sequence chosen from 81 sequences such as 463, 554, 1074, 1277, 676, 524, 258 or 4106 bp given in the specification. The isolated polypeptide and its encoding polypurcleotide are useful for diagnosing and monitoring the presence and metastases of lung cancer in a patient, by determining an amount of the polypeptide or polynucleotide in a sample of a patient, and comparing it to the amount of lung specific marker in a normal control, where a difference in the amount of the nucleic acid or the polypeptide in the sample compared to that of normal control is associated with presence of lung cancer. The polypeptide and polynucleotide are useful as components in databases useful for search analyses and in sequence analysis algorithms. The

The invention relates to isolated polymoticolide (ii) and polypeptide (iii) sequences. (I) is useful as hybridisation probes, polymerase chain recombinant production of (II). The polymoticotides are also used in diagnostics as expressed sequence tags for identifying expressed control is useful in gene therapy techniques to restore normal activity of (II) is useful in gene tags for identifying expressed control in its useful in gene tags states involving (II). (I) is activity of (II) or to treat disease states involving (II). (II) is colypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in the activity. The polypeptide and polymotleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the vival.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to isolated polynucleotide (I) and polypeptide (II)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides an antibody (Ab) comprising donor CDRs (complementarity determining regions) derived from a non-human antibody, and an acceptor framework from a non-human primate. The Abs are prepared by grafting CDRs from a non-human specific donor antibody onto homologous Old World ape or monkey acceptor frameworks. The Abs have reduced immunogenicity and are better tolerated in humans (because of the close similarity between the human and primate projecins), but retain the full antigen-binding affinity of the donor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -uou
